1 Introduction

2 Saturation for Sequences

3 New Results

In the field of **extremal combinatorics**, we ask questions like

Extremal Question

What is the largest possible size of an object which avoids a given forbidden substructure?

In the field of **extremal combinatorics**, we ask questions like

Extremal Question

What is the largest possible size of an object which avoids a given forbidden substructure?

For example:

- What is the largest possible graph on n vertices that does not contain K_3 as a subgraph? (Turan's Theorem & the forbidden subgraph problem)

In the field of **extremal combinatorics**, we ask questions like

Extremal Question

What is the largest possible size of an object which avoids a given forbidden substructure?

For example:

- What is the largest possible graph on n vertices that does not contain K_3 as a subgraph? (Turan's Theorem & the forbidden subgraph problem)
- What is the largest possible group of people, such that for any set of k people, they are not all friends or not all strangers? (Ramsey Theory)

In the field of **extremal combinatorics**, we ask questions like

Extremal Question

What is the largest possible size of an object which avoids a given forbidden substructure?

For example:

- What is the largest possible graph on n vertices that does not contain K_3 as a subgraph? (Turan's Theorem & the forbidden subgraph problem)
- What is the largest possible group of people, such that for any set of k people, they are not all friends or not all strangers? (Ramsey Theory)
- What is the largest possible subset of $\{1, \dots, n\}$ that does not contain a k -term arithmetic progression? (Szemerédi's Theorem)

The **saturation question** is a bit more complicated.

The **saturation question** is a bit more complicated.

Saturation Question

What is the SMALLEST possible structure that avoids a given forbidden substructure, BUT making it larger in any way induces a copy of the forbidden structure?

The **saturation question** is a bit more complicated.

Saturation Question

What is the SMALLEST possible structure that avoids a given forbidden substructure, BUT making it larger in any way induces a copy of the forbidden structure?

In other words: the *minimum* size of a *maximal* structure, rather than the *maximum* size.

Definition

Let G and H be graphs. We say G is H -saturated if G avoids H as a subgraph, but adding any new edge to G induces a copy of H .

Definition

Let G and H be graphs. We say G is **H -saturated** if G avoids H as a subgraph, but adding any new edge to G induces a copy of H .

Example

Consider

The graph

is H -saturated.

Definition

Let G and H be graphs. We say G is H -saturated if G avoids H as a subgraph, but adding any new edge to G induces a copy of H .

Example

Consider

The graph

is H -saturated.

Definition

Let G and H be graphs. We say G is **H -saturated** if G avoids H as a subgraph, but adding any new edge to G induces a copy of H .

Example

Consider

The graph

is H -saturated.

Definition

The **saturation function** $\text{Sat}(n, H)$ is the minimum number of edges in a H -saturated graph on n vertices.

Definition

The **saturation function** $\text{Sat}(n, H)$ is the minimum number of edges in a H -saturated graph on n vertices.

$\text{Sat}(n, H)$ exhibits an **dichotomy**:

Definition

The **saturation function** $\text{Sat}(n, H)$ is the minimum number of edges in a H -saturated graph on n vertices.

$\text{Sat}(n, H)$ exhibits an **dichotomy**:

Theorem (Kászonyi-Tuza, 1986)

We have $\text{Sat}(n, H) = O(1)$ or $\text{Sat}(n, H) = \Theta(n)$.

Definition

The **saturation function** $\text{Sat}(n, H)$ is the minimum number of edges in a H -saturated graph on n vertices.

$\text{Sat}(n, H)$ exhibits an **dichotomy**:

Theorem (Kászonyi-Tuza, 1986)

We have $\text{Sat}(n, H) = O(1)$ or $\text{Sat}(n, H) = \Theta(n)$.

In many other settings, it has been seen that the saturation function exhibits the same dichotomy.

1 Introduction

2 Saturation for Sequences

3 New Results

Sequence Saturation

We use “letters” to refer to the terms in a sequence.

Sequence Saturation

We use “letters” to refer to the terms in a sequence.

Definition

Let s , u be two sequences. We say that s contains a **copy** of u if s has a subsequence that can be turned into u by a *one-to-one* renaming of letters.

Sequence Saturation

We use “letters” to refer to the terms in a sequence.

Definition

Let s , u be two sequences. We say that s contains a **copy** of u if s has a subsequence that can be turned into u by a *one-to-one* renaming of letters.

Example

The sequence $s = 1, 2, 3, 2, 3, 1, 2$ contains a copy of $u = abab$:

1	2	3	2	3	1	2
<i>a</i>	<i>b</i>				<i>a</i>	<i>b</i>

Sequence Saturation

We use “letters” to refer to the terms in a sequence.

Definition

Let s, u be two sequences. We say that s contains a **copy** of u if s has a subsequence that can be turned into u by a *one-to-one* renaming of letters.

Example

The sequence $s = 1, 2, 3, 2, 3, 1, 2$ contains a copy of $u = abab$:

1	2	3	2	3	1	2
<i>a</i>	<i>b</i>				<i>a</i>	<i>b</i>

However, $s = 1, 2, 3, 2, 1$ does not.

Sequence Saturation

We use “letters” to refer to the terms in a sequence.

Definition

Let s, u be two sequences. We say that s contains a **copy** of u if s has a subsequence that can be turned into u by a *one-to-one* renaming of letters.

Example

The sequence $s = 1, 2, 3, 2, 3, 1, 2$ contains a copy of $u = abab$:

1	2	3	2	3	1	2
<i>a</i>	<i>b</i>				<i>a</i>	<i>b</i>

However, $s = 1, 2, 3, 2, 1$ does not.

Definition

A sequence s is r -sparse if every consecutive r letters are pairwise distinct.

Sequence Saturation

We use “letters” to refer to the terms in a sequence.

Definition

Let s, u be two sequences. We say that s contains a **copy** of u if s has a subsequence that can be turned into u by a *one-to-one* renaming of letters.

Example

The sequence $s = 1, 2, 3, 2, 3, 1, 2$ contains a copy of $u = abab$:

1	2	3	2	3	1	2
<i>a</i>	<i>b</i>				<i>a</i>	<i>b</i>

However, $s = 1, 2, 3, 2, 1$ does not.

Definition

A sequence s is r -sparse if every consecutive r letters are pairwise distinct.

Example

The sequence $s = 1, 2, 3, 2, 3, 1, 2$ is 2-sparse, but not 3-sparse.

Definition

Let u be a sequence with r distinct letters. A sequence s is u -saturated if s avoids u , s is r -sparse, and inserting any new letter into s either induces a copy of u or violates r -sparsity.

Definition

Let u be a sequence with r distinct letters. A sequence s is u -saturated if s avoids u , s is r -sparse, and inserting any new letter into s either induces a copy of u or violates r -sparsity.

If we dropped the r -sparsity condition, we would have arbitrarily long sequences like $1, 1, \dots$ which avoid u .

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

s is **3-sparse**: Evident.

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

s **is 3-sparse**: Evident.

Saturation: Suppose we insert a 1 into s . The possibilities are:

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

s **is 3-sparse**: Evident.

Saturation: Suppose we insert a 1 into s . The possibilities are:

1 1 2 3 (violates 3-sparsity)

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

s **is 3-sparse**: Evident.

Saturation: Suppose we insert a 1 into s . The possibilities are:

1 1 2 3 (violates 3-sparsity)

1 1 2 3 (violates 3-sparsity)

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

s **is 3-sparse**: Evident.

Saturation: Suppose we insert a 1 into s . The possibilities are:

1 1 2 3 (violates 3-sparsity)

1 1 2 3 (violates 3-sparsity)

1 2 1 3 (violates 3-sparsity)

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

s **is 3-sparse**: Evident.

Saturation: Suppose we insert a 1 into s . The possibilities are:

1 1 2 3 (violates 3-sparsity)

1 1 2 3 (violates 3-sparsity)

1 2 1 3 (violates 3-sparsity)

1 2 3 1
a b c a (has a copy of u)

Example

If $u = abca$ then the sequence $s = 1, 2, 3$ is u -saturated.

First, $r = 3$ since u has 3 distinct letters. Now we check:

s **avoids** u : Evident.

s **is 3-sparse**: Evident.

Saturation: Suppose we insert a 1 into s . The possibilities are:

1 1 2 3 (violates 3-sparsity)

1 1 2 3 (violates 3-sparsity)

1 2 1 3 (violates 3-sparsity)

1 2 3 1
a b c a (has a copy of u)

Similar checks for the other letters.

Definition

The **saturation function** $\text{Sat}(n, u)$ is the length of the shortest u -saturated sequence with n distinct letters.

Definition

The **saturation function** $\text{Sat}(n, u)$ is the length of the shortest u -saturated sequence with n distinct letters.

In 2021, Anand, Geneson, Kaustav, and Tsai conjectured

Conjecture

We have $\text{Sat}(n, u) = O(n)$.

Definition

The **saturation function** $\text{Sat}(n, u)$ is the length of the shortest u -saturated sequence with n distinct letters.

In 2021, Anand, Geneson, Kaustav, and Tsai conjectured

Conjecture

We have $\text{Sat}(n, u) = O(n)$.

This implies the dichotomy $\text{Sat}(n, u) = O(1)$ or $\Theta(n)$.

Definition

The **saturation function** $\text{Sat}(n, u)$ is the length of the shortest u -saturated sequence with n distinct letters.

In 2021, Anand, Geneson, Kaustav, and Tsai conjectured

Conjecture

We have $\text{Sat}(n, u) = O(n)$.

This implies the dichotomy $\text{Sat}(n, u) = O(1)$ or $\Theta(n)$. They proved

Theorem (Anand-Geneson-Kaustav-Tsai, 2021)

We have $\text{Sat}(n, u) = O(n)$ for all sequences u with two distinct letters.

However, the cases for u having ≥ 3 distinct letters remained completely open.

1 Introduction

2 Saturation for Sequences

3 New Results

Algorithm

Consider the following algorithm:

```
1: Input: Alphabet  $A = \{1, \dots, n\}$ , forbidden sequence  $u$ 
2: Output:  $u$ -saturated sequence
3: Initialize the sequence:  $s \leftarrow 1, 2, \dots, r - 1$  ▷ Initial sequence avoids  $u$ 
4: while it is possible to extend the sequence do
5:   for each letter  $x \in A$  do
6:     if  $x$  can be properly inserted into  $s$  then
7:       Insert  $x$  appropriately into  $s$  to form  $s'$  ▷ Smallest  $x$ , leftmost position
8:       Update  $s \leftarrow s'$  ▷ New sequence
9:       break ▷ Exit loop after the first valid insertion
10:    end if
11:  end for
12: end while
13: Return  $s$  ▷ Final sequence is  $u$ -saturated
```

The output of the algorithm:

Figure: Algorithm on $u = abcacbc$.

Here, we represent $s = s_1 \cdots s_\ell$ by plotting the points (i, s_i) .

The output of the algorithm:

Figure: Algorithm on $u = abcacbc$.

Here, we represent $s = s_1 \cdots s_\ell$ by plotting the points (i, s_i) . Using this pattern, we get $\text{Sat}(n, abcacbc) = O(n)!$

Some more pictures:

Figure: Algorithm on $u = abbacac$ (left) and $abcacba$ (right).

And even more:

Figure: Algorithm on $u = abcacbacb$ (left) and $abcbacbac$ (right).

Algorithm

And even more:

Figure: Algorithm on $u = abcacbacb$ (left) and $abcbacbac$ (right).

This lets us resolve the conjecture for many specific sequences u .

Say u is **irreducible** if u cannot be decomposed into sequences $u = u_1 u_2$ such that u_1 and u_2 have no letters in common.

Say u is **irreducible** if u cannot be decomposed into sequences $u = u_1 u_2$ such that u_1 and u_2 have no letters in common.

Theorem (Kanungo, 2025+)

If u is irreducible and of the form $aa \cdots bb$, then $\text{Sat}(n, u) = O(n)$.

Suppose u is a sequence on 3 letters, and $u = abc \cdots xyz$ where a, b, c are distinct.

Suppose u is a sequence on 3 letters, and $u = abc \cdots xyz$ where a, b, c are distinct. Define

$$f_0(u) = \#\{\text{consecutive pairs of the form } ab, bc, ca\},$$

$$f_1(u) = \#\{\text{consecutive pairs of the form } ac, ba, cb\}.$$

Suppose u is a sequence on 3 letters, and $u = abc \cdots xyz$ where a, b, c are distinct. Define

$$f_0(u) = \#\{\text{consecutive pairs of the form } ab, bc, ca\},$$

$$f_1(u) = \#\{\text{consecutive pairs of the form } ac, ba, cb\}.$$

Theorem (Kanungo, 2025+)

Let $u = abc \cdots xyz$ be a three-letter sequence with a, b, c distinct. Suppose

$$xyz \in \{abc, bca, cab\}, \quad f_0(u) \geq f_1(u) + 5.$$

Then $\text{Sat}(n, u) = O(n)$.

Theoretical Results

Suppose u is a sequence on 3 letters, and $u = abc \cdots xyz$ where a, b, c are distinct. Define

$$f_0(u) = \#\{\text{consecutive pairs of the form } ab, bc, ca\},$$

$$f_1(u) = \#\{\text{consecutive pairs of the form } ac, ba, cb\}.$$

Theorem (Kanungo, 2025+)

Let $u = abc \cdots xyz$ be a three-letter sequence with a, b, c distinct. Suppose

$$xyz \in \{abc, bca, cab\}, \quad f_0(u) \geq f_1(u) + 5.$$

Then $\text{Sat}(n, u) = O(n)$.

Corollary

For any sequence u on 3 letters, $\text{Sat}(n, (abc)u(abc)^t) = O(n)$ for large enough t .
